ABSTRACT

To eradicate the violence from a nation, this type of article could help. After reviewing information, we could say that violence was common in our ancestry, but this is possible to overcome through understanding the human and animal behaviour.

INTRODUCTION

Humanity has always been fascinated and horrified by the darker side of human nature. Rebellion, retribution, jealousy, and murder all happened within the first biblical family. Recent reductions of criminal violence also probably involved physical environmental influences. Genetic causes cannot explain the recent decline of violence. High sociability, cooperative nature, human cultural systems entail selection pressure for a quality still poorly defined—emotional intelligence [1]. There had to be some role for coalitional male violence in human evolution, male gangs fought with a view to taking over territory and access to females. Tribal and band societies are presented as lesser beings, violent and brutish as wild predators. It is thus crucial to factor in the impact of alcohol and the history of colonial and structural violence in our reflections about the environmental causes of physical violence. During a two-million-year history human brains expanded especially the frontal lobes and prefrontal cortex. Morality of our evolutionary history older than religion and older than our species. We humans may yet again find peace more to our advantage than war [2]. The incidence of violence is common in all living creatures especially in males. This is one kind of instinct and sometimes important for their livelihood. For protecting themselves and searching of catching foods, this is an important behaviour. If unwanted aggression comes this could be an offense or threatened to another organisms. Unwanted violence makes a hazard to the society as well as on family members. Domestic violence of males in a family creates painful psychological issues in their body especially children. Children do not forget

those bad memories in their brain, and sometimes this could lead suicide. History says that from the very beginning males were used to fight to each other and that time those fighting and aggression were the only qualification of males. Not only humans but also in other animals' males are usually more muscular than females, so they show their power naturally. At the present context, consciousness and power of knowledge give us correct way to behave to other people. Some movies are more focused with violence and sometimes those could not be swallowed especially weak-hearted people. Excess secretion of testosterone and adrenaline plays a role to do this unwanted violence. Many psychological disturbances promote unwanted violence to others. In any mental hospitals, we handle many psychological patients and most of them are violent to others. Motivation, physiotherapy as well as good behaviour with them sometimes could give us solution. Sexual violence on female child is the second issue in this field. Ultimate violence kills huge innocent people of the society. At the time of aggression, the facial appearance will be different [3]. Naturally birds do not have facial muscles, so they could not express their aggression only devoid of fluffing of the feathers after courtship [4]. Very violent person sometimes could show very smart activity that is really appreciable. In fact, this is an abnormal activity of human hormones. In our body we have many hormones [5]. A child grows up with the childish way, female baby, male baby, and old-aged people will be treated differently. Parents children relationship will be good always in a family. A good-mannered movie could be an example for everybody. All people should be engaged with their hobbies and of course this is good for handle their mind. We need to control our body, brain, soul, and mind [6]. The objective of this review is to mention the history of the violence in man and animals.

Violence in animals:

In animals especially apes (gorilla, chimpanzee, gibbon, orang-utan) exhibit lot of violence to others. At the time of breeding season some males show very painful sexual violence to the females. Sometimes some females cannot survive smoothly and young also for the predation of males in a community. In animal kingdom naturally males are adapted to catch the preys, so they need aggression, whereas females are calm and very affectionate to their young and male partner too. Other males think the young as their competitor, so sometimes they kill those young. For avoiding such aggression of males sometimes females go far from the males at the time of birth or caring their young. In Bangladesh, violence on animals especially street dogs are vulnerable on this issue. Local people throw hot water on dogs, cut their tail and ear, castration (spaying), and break the legs are very common phenomena [7]. Herbivore animals are less violent than carnivores.

CONCLUSIONS

In our educational institutions we could imply a chapter on violence for providing clear conception on violence with their remedies or solution. Nobody likes violence but very common in everywhere and at any moments. Everybody should know that violence will come suddenly, so need to understand those people who are violent or understand the behaviour of all the family members. Precaution is the real solution for avoiding such bad acts in the society or family. Normally a violent human shows very normal physical and mental attitude to the other persons, so sometimes very difficult to understand the coming events. To understand human behavioural psychology is always appreciated and the basic knowledge on this issue need to implement for everybody. Bad companies to our students could enhance many violence. Violent child could kill their parents, so we should carefully handle our children at any cost. A family history of aggression could help us to avoid this act. Positive thinking, passing time with good hobbies, maintaining a healthy lifestyle, and at the end of the day a proper rest could make you fresh for the next day without any violence.
